

d64dir – Show the directory within cmd

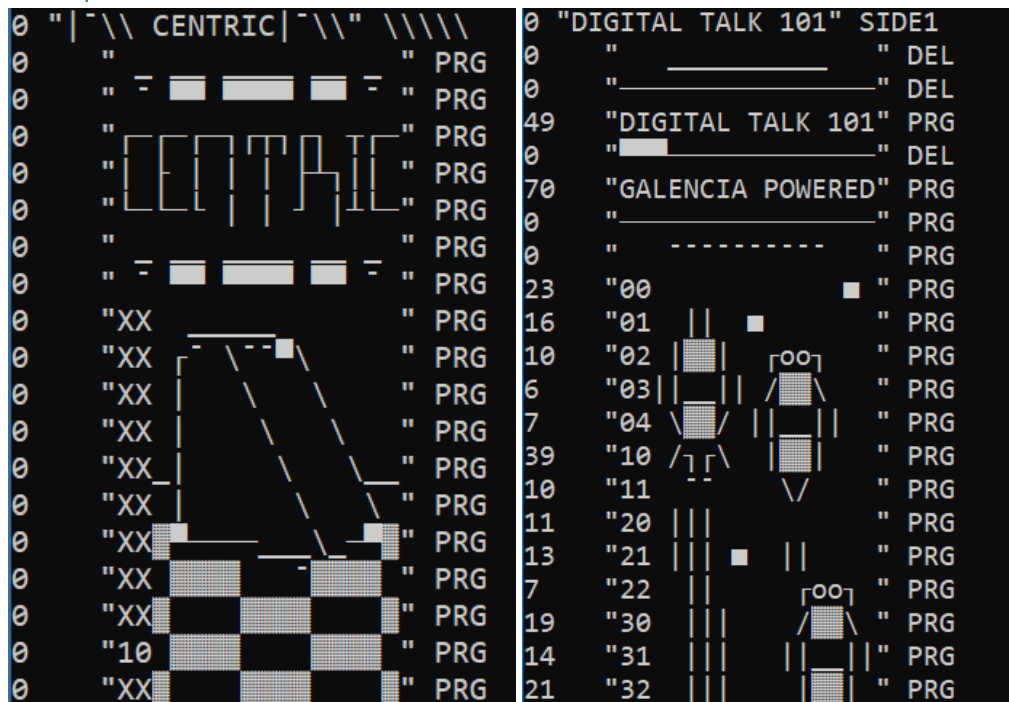

About

d64dir is a simple tool. It will just show the directory of a d64 file within cmd.

Because the font used in cmd does not match PETSCII the characters are mapped as good as possible. Sadly, most characters (except of letters and numbers) don't match well. The tool tries it's best and offers also an alternative translation.

The font used for testing was Consolas. The codepage it is optimized for is 850 – OEM Multilingual Latin I.

Examples

Usage

d64dir is a windows command line tool and can therefore be used within cmd as follows:

```
d64dir [-a] <d64 file>
```

<d64 file> ... D64 file to be shown

-a Use alternative presentation (optional)

Always provide the full file name including extension .d64
